

1 A portrait A4 page

This first page uses the international A4 size in portrait orientation. It is the most common page size for papers written outside North America, and the size that most layout code implicitly assumes.

A reader that computes page offsets from the first page alone will place every later page of this document in the wrong position, because none of the following pages has the same dimensions as this one.

2 A landscape A4 page

This second page is wider than it is tall. Wide tables and large diagrams are often set on such pages in appendices and supplementary material.

The page keeps its landscape shape in the file itself, so no rotation is needed to display it the right way up.

3 A portrait US Letter page

This third page uses the North American letter size, which is slightly wider and shorter than A4. Documents assembled from several sources often mix the two sizes without anyone noticing.

4 A rotated letter page

This fourth page is stored as a portrait letter page with a rotation of ninety degrees, the way many tools produce landscape pages. Its text runs along the long edge of the paper once the rotation is applied.

The width and height reported for this page therefore depend on whether the rotation is taken into account.
